CubeSLAM示例编译运行

效果

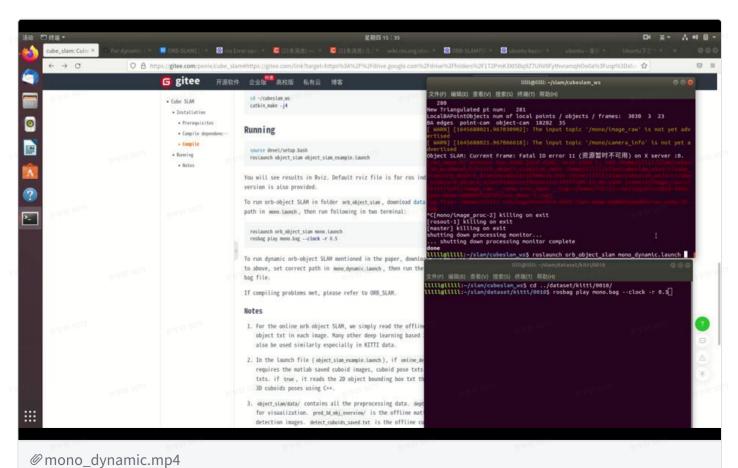

orbject_slam

orb_object_slam mono

orb_object_slam mono dynamic

这里给出一个作者在youtube上的效果视频,在源码基础上做了他自己的一些修改,效果比示例跑出 来要好一些

CubeSLAM: Monocular 3D Object Detection and SLAM without Prior Models

Shichao Yang, Sebastian Scherer

Robotics Intitute, Carnegie Mellon University

Ødemo.mp4

记录

源码: GitHub - shichaoy/cube_slam: CubeSLAM: Monocular 3D Object Detection and SLAM

编译环境: Ubuntu 18.04 + ros melodic

CubeSLAM依赖: Eigen.Pangolin.Opencv.PCL

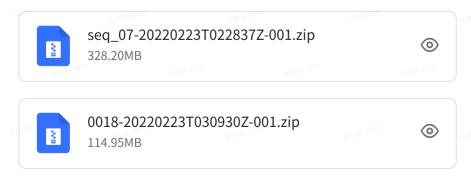

- 1. 源码编译会在"iota","std:vector","usleep"等处报错,需要在报错处对应添加#include <numeric>,#include <vector>,#include <unistd.h>。此处有已修改好的源码: GitHub zhezhou1993/cube_slam: CubeSLAM: Monocular 3D Object Detection and SLAM
- 2. 采用Eigen 3.3.7版本可以编译成功,但在跑object slam时出现double free or corruption的问题,github上提到是Eigen对齐问题。换成ubuntu源自带的libeigen3-dev可以成功,eigen版本为3.2.92。
- 3. 如果使用高翔老师《视觉SLAM十四讲》第三方库中的Pagolin,有可能报错Pagolin X11,按路径注释掉图中两行重新编译即可。

```

4. orb_object_slam会在Vocabulary文件夹下报错。是因为论文作者应该后期优化过代码,词袋部分使用了ORBvoc.bin,直接下载的代码并没有,将ORBvoc.bin拷贝到Vocabulary文件夹下。

5. 数据集来自作者github上所给链接,seq_07为mono的数据,0018为mono_dynamic的数据

数据路径在orb_object_slam/launch/mono.launch中修改,使用的是seq_07数据

```
image_rect_color /kinect2/qhd/image_color_rect /camera/mono/image_raw
   </node>
   <param name="enable_loop_closing" value="false" /> # false true
                                                    <param name="enable_viewmap" value="true" />
<param name="enable_viewer" value="true" />
<param name="enable_viewimage" value="true" />
   <param name="parallel_mapping" value="true" /> # if false, may reduce bag rate
    <rosparam file="$(find orb_object_slam)/launch/object_params/kitti.yaml" command="load"/>
<param name="whether detect object" value="true"</pre>
   cyparam name="whether_read_offline_cuboidtxt" value="true" /> # for kitti, I read offline data.
cyparam name="associate_point_with_object" value="true" />
cyparam name="obj_det_2d_thre" value="0.5" /> # for online 3D detection
                                                                                                             slam/object_slam/
                                                                                                             /object_slam$ ls
Thirdparty
   <param name="bundle_object_opti" value="true"</pre>
  <param name="build_worldframe_on_ground" value="true" />
<param name="camera_object_BA_weight" value="2.0" /> #2.0 default
                                                                                                             /object_slam$ cd ../orb_object_slam/
/orb_object_slam$ gedit launch/mono.
  # not orb features
    cparam name="use_truth_trackid" value=
                                                          # use offline tracking id if false, need to
# need depth init
   <param name="ba_dyna_obj_cam" value="true" /:</pre>
                                                         HTML ▼ 制表符宽度: 8 ▼ 第16行, 第79列 ▼ 插入
```

类似的修改mono_dynamic.launch中的路径,使用0018数据以mono为例运行,在两个终端分别执行如下命令,运行mono_dynamic改为mono_dynamic.launch

```
roslaunch orb_object_slam mono.launch
rosbag play mono.bag --clock -r 0.5
```

第一行在cubeslam_ws下执行,第二行在数据集路径下执行,注意作者所给seq_07中的bag文件名不是mono,需要自己重命名以下,否则打不开mono.bag。

6. 如果Opencv版本合适,基本上就跑通示例了,对于部分Opencv版本会报gtk 2.0与gtk 3.0不能同时存在的问题。这是由于ros melodic自带了opencv 3.2.0与自己安装的opencv版本会不兼容。解决办法为: 卸载ros自带的opencv sudo apt-get remove libopencv-core3.2,然后补齐ros所需的功能包,地址: https://github.com/ros-perception/vision_opencv,包括cv_bridge,image_geometry,image_proc等,放入ros工作站(cubeslam_ws)的src文件夹下,参考专栏:https://zhuanlan.zhihu.com/p/400316912,我在Config文件中链接好了cv_bridge,所以src中只有两个功能包。

```
lllll@llll:~/slam/cubeslam_ws/src$ ls
CMakeLists.txt cube_slam image_geometry image_proc
```

重新编译,如果出现cv_bridge编译报错,有可能是与python版本冲突的原因,解决方法参考: https://gitee.com/bingobinlw/cv_bridge/blob/master/README.md

以上就是CubeSLAM编译运行遇到的一些问题,最终Eigen使用ubuntu源自带的libeigen3-dev,版本为3.2.92,pagolin为高翔slambook的第三方库,opencv版本为3.4.0(会出现gtk报错),PCL来自github上的最新版本,gitee上有镜像文件。
